Supporting Integrated Ecosystem Assessment Under Model Structural
Uncertainty

A Dissertation in
Marine Science and Technology–Living Marine Resources Science and
Management

by

Robert Paul Wildermuth

Submitted in Partial Fulfillment of the
Requirements for the Degree of
Doctor of Philosophy

August 2021

Preface

This dissertation is comprised of four research chapters, the first of which was prepared as a manuscript for publication in a peer-reviewed scientific journal. The candidate was responsible for data analysis, interpretation of results, and manuscript preparation, but each chapter was carried out in consultation with members of the committee. The co-authors for each chapter are listed below.

Chapter 1: Wildermuth, R.P., Fay, G., and Gaichas, S. (2018) Structural uncertainty in qualitative models of ecosystem-based management of Georges Bank. *Canadian Journal of Fisheries and Aquatic Sciences*. 75(10): 1635-1643. <https://doi.org/10.1139/cjfas-2017-0149>. Many thanks go out to the members of the ICES Working Group on the Northwest Atlantic Regional Seas for their efforts to construct the Georges Bank conceptual model and provide feedback about analytical results. Funding for RPW and GF was supported by the NOAA Fisheries Quantitative Ecology and Socioeconomics Training (QUEST) program through the Cooperative Institute for the North Atlantic Region via federal awards NA09OAR4320129 and NA14OAR4320158. RPW was also supported by MIT Sea Grant under federal award NA14OAR4170077. The manuscript was improved following the helpful comments of three anonymous reviewers.

Chapter 2: Robert P. Wildermuth, Gavin Fay, Sarah Gaichas, and Geret DePiper. I thank the NOAA Fisheries Northeast Fisheries Science Center (NEFSC) Ecosystem Dynamics and Assessment Branch and NOAA Fisheries scientists who provided time series for indicators in the Georges Bank model and participated in model review. I also thank the social sciences experts for responding to the social and cultural values survey. Funding for RPW was supported by the NMFS/Sea Grant Population and Ecosystem Dynamics Graduate Fellowship via federal award NA14OAR4170077.

Chapters 3 and 4: Robert P. Wildermuth and Gavin Fay. Funding for RPW was supported by the National Marine Fisheries Service (NMFS)/Sea Grant Population and Ecosystem Dynamics Graduate Fellowship via federal award NA14OAR4170077.

I offer my greatest thanks to my advisor, Dr. Gavin Fay, and my NMFS mentor, Dr. Sarah Gaichas, who have offered support and guidance, even when I did not know I needed it or how to ask for it. I also thank my committee members, past and present: Dr. Ingrid van Putten for helping guide development of the social and cultural values survey, Dr. Geoff Cowles for providing insight into the biophysical drivers of the Georges Bank, Dr. David Koop for helping to organize and visualize this complex system and equally complicated model output, and Department Chair Dr. Steven Cadrin for providing me the opportunity to study the interdisciplinary field of fisheries management and for your optimistic view. Without the help of my committee, I would not have achieved so much.

I also thank the University of Massachusetts Dartmouth, School for Marine Science and Technology, Department of Fisheries Oceanography, and the University of Massachusetts Intercampus Marine Science Graduate Program for the opportunity to earn my degree through this institution and for the funding that supported travel throughout my program. I thank the NOAA Fisheries Quantitative Ecology and Socioeconomics Training (QUEST) program, the Cooperative Institute for the North Atlantic Region (CINAR), MIT Sea Grant, the National Marine Fisheries Service/Sea Grant Population and Ecosystem Dynamics Graduate Fellowship, the Washington State Department of Ecology, and Sound Resolutions for funding my research assistantships throughout my studies.

I owe a debt of gratitude to the members of the International Council for the Exploration of the Sea (ICES) Working Group on the Northwest Atlantic Regional Seas and the NEFSC Ecosystem Dynamics and Assessment Branch. In particular, I thank Dr. Sean Lucey, Robert Gamble, and Sean Hardison for insight into the world of ecosystem modeling and NOAA Fisheries data. I thank the current and past chairs of the WGNARS working group, including Drs. Robin Anderson, Robert Gregory, and Jamie Tam. I also thank Drs. Trish Clay, Patricia Pinto da Silva, Lisa Colburn, and Geret DePiper for fruitful discussions and guidance on understanding indicators of social wellbeing in fisheries systems. For help sourcing data for the Bayesian network, I thank Harvey Walsh, Michael McHugh, and Drs. Kimberly Hyde, Laurel Smith, Kristen Kleisner, Nell den Heyer, David Mountain, Kevin Friedland, Michael Fogarty, Vincent Saba, and Kathryn Ford. I also thank my collaborators at the NOAA Integrated Ecosystem Assessment Program and Atlantis ecosystem modeling experts: Drs. Neda Trifonova,

Chris Harvey, Chris Kelble, Kirsten Leong, Jon Reum, P. Sean McDonald, Beth Fulton, Alan Haynie, Howard Townsend, and Isaac Kaplan. I am also grateful for the efforts of Dr. Jason Link and Dr. Rebecca Shuford for being our standard bearers in marine ecosystem-based management.

I must thank my Fay Lab peers, past and present, for having my back, providing shoulders to lean on, and your bright smiles in the darkness of doubt (or the Fairhaven building basement): Ashley Weston, Megan Winton, Liberty Schilpp, Ashleigh Novak, Amanda Hart, Lucy McGinnis, Dr. Tammy Silva, Dr. Jonathan Cummings, Dr. Vanessa Trijoulet, Sofia Gabriel, and Samantha Weiss. I am also grateful for the support and friendship of my fellow Intercampus Marine Science and UMass Dartmouth students: Molly Morse, Brooke Lowman, Kate Tremblay, Dr. Georgia Kakoulaki, Dr. Douglas Zemeckis, Dr. Chang Liu, Dr. Judith Rosellon Druker, Dr. Katyanne Shoemaker, and Dr. Bia Dias. I owe many thanks to the UMass Dartmouth faculty, staff, and administration, including Dean Steve Lohrenz, Cindy Costa, Sue Silva, Arlene Wilkinson, Gail Lyonnais, Chris Fox, Adrienne Wartts, and Drs. Robert Griffin, Jim Bisagni, Avijit Gangopadhyay, and Kevin Stokesbury. I also appreciate the help of the Out in Science, Technology, Engineering, and Mathematics (oSTEM) mentorship program, and my oSTEM mentor, Margi Whitmore for her advice and support.

I would be nothing without my family, both chosen and biological, whom I owe more than just thanks. Thank you to my mother, Mary, for serving as an example of patience and persistence. Thanks to my father, Mark, for providing for my education and wellbeing throughout the years and encouraging me to think differently. Thank you to Aunt Lynn and Uncle Jim, Anne Jemming, Robbin LaFond, Stef Grant, and Amy and Mark McKeon for being my cheerleaders along the way. To my chosen siblings, Brian Keener, Suvinda Leidhold, Danny and Abi Pendleton, I do not know how I can ever thank you enough. And special thanks to my New Bedford family, Yun Hao, Dana Brown, Leili and Jamie DeLande, Sapna Piracha, Agata Piffer Braga, Dr. Jana del Favero, Dr. Janne Haugen, Thomas Hyman, Dr. Alex Hansell, Matt Wheeler, Lauren Fallabella, and Will Helt; without you I would be lost.

I must recognize the Wampanoag and Nauset tribes whose heritage is anchored in the shores of Southern New England and the coastal waters of the Georges Bank social-ecological system, which served as my case study for this dissertation. I regret this cultural heritage did not

play a larger role in my studies, but I hope this work further emphasizes the need to account for and strengthen these traditions and knowledge of this system.

I thank the Moshassuck River for its tranquil rippling waters and the iridescent waves of Buzzards Bay, which provided relief during long nights and midday walks spent thinking about complex marine systems.

I will finally thank Deb Sardone. Though we do not know each other, her encouragement saw me through one of the hardest times of my life. She reminded me that this work matters, “to me – and to the generation that follows us.”
